CERTIFICATE

This is to certify that the Lab work entitled "Database Management Systems (22CS3PCDBM)" conducted by **SAMRAAT DABOLAY (1BM22CS236),** who is bonafide student at **B.M.S.College of Engineering**. It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** during the academic year 2023-24. The Lab report has been approved as it satisfies the academic requirements in respect of a Database Management Systems (23CS3PCDBM) work prescribed for the said degree.

1. Insurance Database

PROGRAM 1: INSURANCE DATABASE

Consider the Insurance database given below:

PERSON (driver_id: String, name: String, address: String)

CAR (reg_num: String, model: String, year: int)

ACCIDENT (report_num: int, accident_date: date, location: String)

OWNS (driver_id: String, reg_num: String)

PARTICIPATED (driver_id: String,reg_num: String, report_num: int, damage_amount: int)

i. Create the above tables by properly specifying the primary keys and the foreign keys.

ii. Enter at least five tuples for each relation.

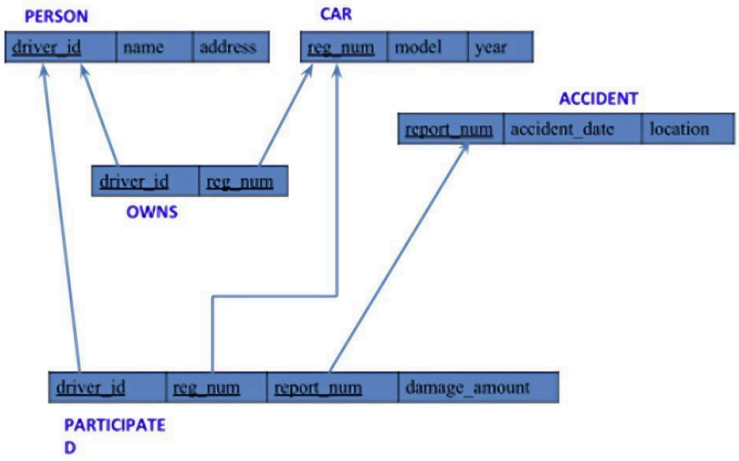
iii. Display Accident date and location.

iv. Update the damage amount to 25000 for the car with a specific reg_num (example 'KA053408') for which the accident report number was 12.

v. Add a new accident to the database.

vi. Display driver id who did accident with damage amount greater than or equal to Rs.25000.

Schema Diagram:



Creating Database and Table:

```
create database insurance_141;
use insurance_141;

Create table person(
driver_id varchar(20),
name varchar(30),
address varchar(50),
PRIMARY KEY(driver_id) );
Create table car(
reg_num varchar(15),
model varchar(10),
```

```
year int,
PRIMARY KEY(reg_num)
);
Create table owns(
driver_id varchar(20),
reg_num varchar(10),
PRIMARY KEY(driver_id, reg_num),
FOREIGN KEY(driver_id) REFERENCES person(driver_id),
FOREIGN KEY(reg_num) REFERENCES car(reg_num)
);
Create table accident(
report_num int,
accident_date date,
location varchar(50),
PRIMARY KEY(report_num)
);
Create table participated(
driver_id varchar(20),
reg_num varchar(10),
report_num int,
damage_amount int,
PRIMARY KEY(driver_id,reg_num,report_num),

2. More Queries on Insurance Database

PROGRAM 2. More Queries on Insurance Database

PERSON (driver_id: String, name: String, address: String)
CAR (reg_num: String, model: String, year: int)
ACCIDENT (report_num: int, accident_date: date, location: String)
OWNS (driver_id: String, reg_num: String)
PARTICIPATED (driver_id: String,reg_num: String, report_num: int, damage_amount: int)
Create the above tables by properly specifying the primary keys and the foreign keys as done in "Program 1"week's lab and Enter at least five tuples for each relation.

i. Display the entire CAR relation in the ascending order of manufacturing year.
ii. Find the number of accidents in which cars belonging to a specific model (example 'Lancer') were involved.
iii. Find the total number of people who owned cars that involved in accidents in 2008.
iv. List the Entire Participated Relation in the Descending Order of Damage Amount. Find the Average Damage Amount.
v. Delete the Tuple Whose Damage Amount is below the Average Damage Amount.
vi. List the Name of Drivers Whose Damage is Greater than The Average Damage Amount.
vii. Find Maximum Damage Amount.

Creating database and table:

Database insurance_141 and tables as per schema were created in the previous lab and it is as shown in the previous experiment.

Queries :

i. Display the entire CAR relation in the ascending order of manufacturing year.

```
select * from car order by year asc;
```

reg_num	model	year
KA031181	Lancer	1957
KA052250	Indica	1990
KA095477	Toyota	1998
KA041702	Audi	2005
KA053408	Honda	2008
NULL	NULL	NULL

ii. Find the number of accidents in which cars belonging to a specific model (example 'Lancer') were involved.

```
select count(report_num)
from car c, participated p
where c.reg_num=p.reg_num and c.model='Lancer';
```

count(report_num)
1

iii. Find the total number of people who owned cars that were involved in accidents in 2008.

```
select count(distinct driver_id) CNT
from participated a, accident b
where a.report_num=b.report_num and b.accident_date like '%2008%';
```

CNT
1

iv. List the entire participated relation in the descending order of damage amount.

```
select * from participated order by damage_amount desc;
```

Find the average damage amount

```
SELECT AVG(damage_amount) from participated;
```

AVG(damage_amount)
13600.0000

driver_id	reg_num	report_num	damage_amount
A02	KA053408	12	25000
A03	KA095477	13	25000
A01	KA052250	11	10000
A05	KA041702	15	5000
A04	KA031181	14	3000
NULL	NULL	NULL	NULL

v. Delete the tuple whose damage amount is below the average damage amount .

```
delete from participated  where damage_amount < (select
p.damage_amount from(select AVG(damage_amount) as
damage_amount FROM participated p);
select * from participated;
```

driver_id	reg_num	report_num	damage_amount
A02	KA053408	12	25000
A03	KA095477	13	25000
NULL	NULL	NULL	NULL

vi. List the name of drivers whose damage is greater than the average damage amount.

```
select name from person p, participated part where p.driver_id=part.driver_id and
damage_amount>(select AVG(damage_amount) FROM participated);
```

name

vii. Find maximum damage amount.

```
select MAX(damage_amount) from participated;
```

MAX(damage_amount)
25000

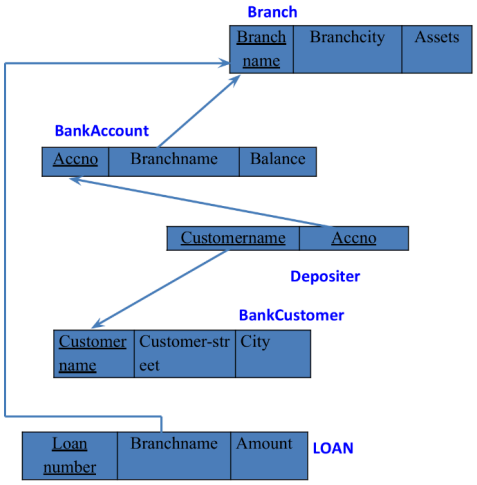
3. Bank Database

PROGRAM 3: Bank Database

Branch (branch-name: String, branch-city: String, assets: real)
BankAccount(accno: int, branch-name: String, balance: real)
BankCustomer (customer-name: String, customer-street: String, customer-city: String)
Depositer(customer-name: String, accno: int)
LOAN (loan-number: int, branch-name: String, amount: real)

i. Create the above tables by properly specifying the primary keys and the foreign keys.
ii. Enter at least five tuples for each relation.
iii. Display the branch name and assets from all branches in lakhs of rupees and rename the assets column to 'assets in lakhs'.
iv. Find all the customers who have at least two accounts at the same branch (ex. SBI_ResidencyRoad).
v. Create A View Which Gives Each Branch the Sum of The Amount of All The Loans At The Branch.

Schema Diagram :



Creating Database and Table:

i. Find all the customers who have an account at all the branches located in a specific city (Ex. Delhi).

ii. Find all customers who have a loan at the bank but do not have an account.

iii. Find all customers who have both an account and a loan at the Bangalore branch .

iv. Find the names of all branches that have greater assets than all branches located in Bangalore.

v. Demonstrate how you delete all account tuples at every branch located in a specific city (Ex. Bombay).

vi. Update the Balance of all accounts by 5%

Queries :

i. Find all the customers who have an account at all the branches located in a specific city (Ex. Delhi).

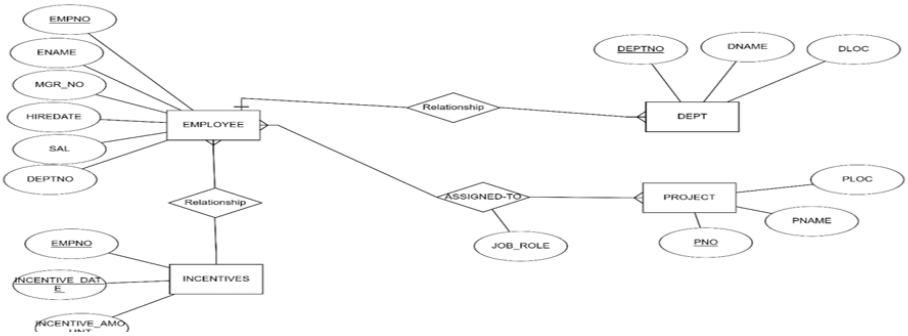
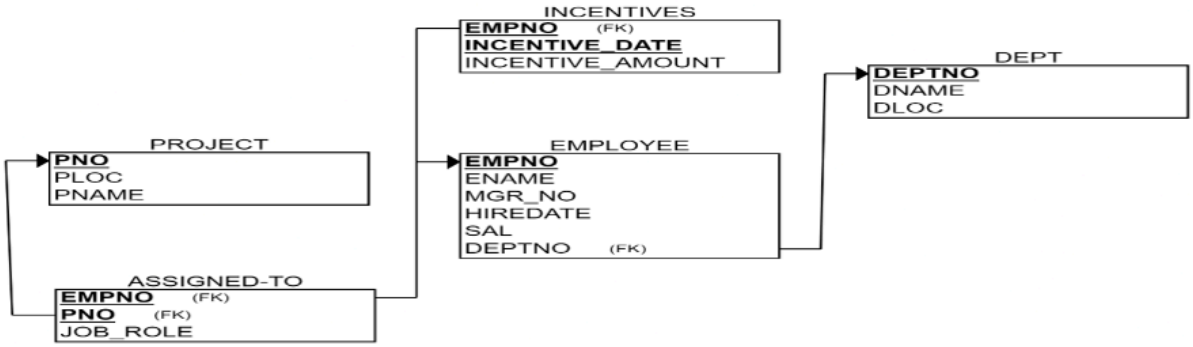
5. Employee Database

PROGRAM 5: Employee Database





i. Using Scheme diagram, create tables by properly specifying the primary keys and the foreign keys.
ii. Enter greater than five tuples for each table.
iii. Retrieve the employee numbers of all employees who work on project located in Bengaluru, Hyderabad, or Mysuru.
iv. Get Employee IDs of those employees who didn't receive incentives.
v. Write a SQL query to find the employees name, number, dept, job_role, department location and project location who are working for a project location same as his/her department location.

Creating of database and tables:

```
create database employee_141;
use employee_141;

create table project(
pno int,
ploc varchar(40),

6. More Queries on Employee Database

PROGRAM 6: More Queries on Employee Database

i. Using Scheme diagram (under Program-5), Create tables by properly specifying the primary keys and the foreign keys.
ii. Enter greater than five tuples for each table.
iii. List the name of the managers with the maximum employees.
iv. Display those managers name whose salary is more than average salary of his employee.
v. Find the name of the second top level managers of each department.
vi. Find the employee details who got second maximum incentive in January 2019.
vii. Display those employees who are working in the same department where his manager is working.

Queries:

iii. List the name of the managers with the maximum employees

```
select ename from employee
group by mgr_no
having count(empno) =
(select max(y.num) from
(select count(empno) as num from employee group by mgr_no) y);
```

ename

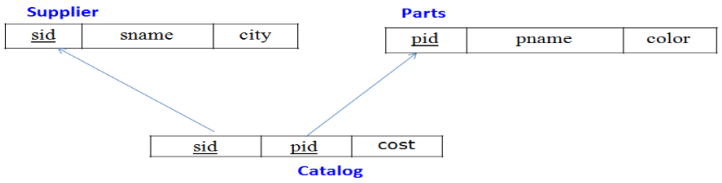
7. Supplier Database

PROGRAM 7: Supplier Database



i. Using Scheme diagram, create tables by properly specifying the primary keys and the foreign keys.
ii. Insert appropriate records in each table.
iii. Find the pnames of parts for which there is some supplier.
iv. Find the snames of suppliers who supply every part.
v. Find the snames of suppliers who supply every red part.
vi. Find the pnames of parts supplied by Acme Widget Suppliers and by no one else.
vii. Find the sids of suppliers who charge more for some part than the average cost of that part (averaged over all the suppliers who supply that part).
viii. For each part, find the sname of the supplier who charges the most for that part.

Creating database and table:

```
create database supplier_141;
use supplier_141;

create table Supplier
        (sid int primary key,
        sname varchar(35),
        city varchar(35));

create table parts
        (pid int primary key,
        pname varchar(35),
        color varchar(35));

create table catalog
        (sid int,
        pid int,
        cost float,
        primary key(sid,pid),
        foreign key(sid) references Supplier(sid),
        foreign key(pid) references parts(pid));
```

Inserting values to tables:

```
insert into Supplier values
        (10001,"Acme Widget","Bangalore"),
```

sid	sname	city
10001	Acme Widget	Bangalore
10002	Johns	Kolkata
